

Harpo special exercise: availability

Availability is, in a certain sense, the most important information security goal. Without it, there is no data, not even exposed or unauthentic or lacking integrity ...

The idea of this exercise and its format is to give you an essay-like experience early on during your course and some interaction with the teacher who otherwise will be quite far at the background.

Take into use:

1. A password management application that is not limited to one device or browser. Some of the most famous ones are LastPass, KeePass, Bitwarden and Dashlane, and more can be found in e.g. Wikipedia's table.
2. Cloud storage or another *data backup method*. You may already have OneDrive, iCloud or GoogleDrive through your operating system, and you can continue with that. Other cloud storage options without financial costs are DropBox, Degoo, and Mega. You can find others too. All of those mentioned here can be used for the actual backup as well, but you may also have a separate procedure for that.
3. File transfer, especially for large files that cannot fit in e-mail. Mail can hold a lot, but it's good to think about the recipient's mailbox as well. The storage services mentioned above are also suitable for file transfer, and you may manage with your choice, but you must make sure the recipient does not need anything beyond a browser. This may exclude the use of a peer-to-peer network. A filedrop application is likely to be ok. An anonymous file service can also be interesting in this regard. Such are e.g. MyAirBridge, SendSpace and UpLoadFiles.io. There are others.

Find out the characteristics of your choices, and answer questions in rather free format into a Word or LibreOffice document. The password to open either document is: NothingToHideYet. Submit the document by sending it by your file transfer service to the teacher - after changing the password, as instructed in the document.
